

ANGLED RIDING STIRRUP

ABSTRACT OF THE DISCLOSURE

3 A riding stirrup (10) includes a hanger rod (11) for connecting the stirrup to a saddle, and
4 a stirrup loop (12) connected to the hanger rod. The stirrup loop (12) defines a stirrup opening
5 (14) through which a rider may extend their foot when the rider is sitting in the saddle. The
6 stirrup loop (12) also includes an elongated base support tread (17) positioned generally at the
7 bottom of the loop. The base support tread (17) extends at a slant with respect to a stirrup
8 centerline (CL) which extends perpendicular to the longitudinal axis of the hanger rod (11),
9 through a midpoint of the rod, and through the base support tread. This slant places the distance
10 between an outer tread section (21) and the hanger rod (11) greater than the distance between an
11 inner tread section (20) and the hanger rod.
